

Radiant Heat Series

Vented Gas Logs

Radiant Heat logs redefine the role of a vented gas log set. Our revolutionary molding process captures all the detail you expect from Hargrove in ceramic fiber, for maximum heat radiance. Our Radiant Riser technology directs this heat forward into the room, creating radiant heat output comparable to vent-free, with the natural beauty of vented logs.

Rustic Timbers 24" Set

Rustic Timbers resembles a real wood fire stack by cross stacking beautifully textured split and charred logs.

- Available in 21" to 36" sizes
- Peaks of flame and glow throughout the log stack
- See-Thru models available

Woodland Timbers 24" Set

Woodland Timbers provides an open burned through area in the middle of the stack to view the warm glow of char chunks and embers.

- Available in 21" to 36" sizes
- Open area of flame and glow in the middle of the stack
- See-Thru models available

Canyon Timbers 24" Set

Canyon Timbers logs have a striking look with their deep bark texture and detailed char areas. Flames work through all areas of the log stack resembling a roaring campfire.

- Available in 21" to 36" sizes
- Mature fire with open viewing area for flames and ember bed
- See-Thru models available

Cross Timbers 24" Set

Cross Timbers makes a statement with front logs that appear to be freshly burned through providing an open view to flame depth and warm glow.

- Available in 21" to 36" sizes
- Taller front log profile with stunningly textured top logs
- See-Thru models available

Aspen Timbers 24" Set

Aspen Timbers has a clean, contemporary look with all of the performance that Hargrove's Radiant Heat Logs are known for.

- Available in 21" to 36" sizes
- Modern, contemporary appearance
- See-Thru models available

Radiant Heat Technology

Ceramic Fiber Logs – The properties of our Timbers Series ceramic fiber logs are different than refractory or concrete logs. Refractory logs radiate some heat, but mostly absorb the heat into the body of the log. Our Timbers Series ceramic fiber logs push or radiate heat off of the heated surface of the log into the living space, thus taking full advantage of the heat being produced by the flame.

H-Burner – To help achieve the most radiant heat, it is important to heat more surface area on the logs. Although all of our burner systems work fine with the Timbers Series, our H-Burner produces the largest body of flame, thus maximizing the radiant heat output.

Radiant Riser (included in Radiant Heat sets) – This U-Shaped log piece helps by creating a heat chamber in the middle of the log stack.

Radiant Glow Bracket (included in Radiant Heat sets) – A piece that attaches to the back of the H-Burner which bridges the gap between the back wall of the burner and the Radiant Riser. The barrier created directs the flame and heat to the heat chamber, thus maximizing the radiant heat production.

- A – Back Log
- B – Radiant Riser
- C – Radiant Glow Bracket
- D – H-Burner
